Neeraj Dalal

AI-native product engineer building SaaS, developer tools and agent infrastructure, with 6+ years in full-stack TypeScript. At LightWork AI, I help build an AI-powered property-management platform across the full stack: agents, UI and infrastructure. On my own time I build ZeroStarter, production-ready SaaS infrastructure with world-class human and agent DX, and on top of it an agent factory where Claude Code sessions ship software. Author of open-source tools with 1,100+ GitHub stars across 250+ repositories, 13,500+ VS Code installs and 30,000+ weekly npm downloads, used by projects including TanStack, SST, Electric SQL, and Storybook. *I learn by shipping, and I sweat build performance, type safety, and release automation.*

New Delhi, India (open to relocate) | nrjdalal.dev@gmail.com | github.com/nrjdalal | linkedin.com/in/nrjdalal

Core Strengths

- AI product engineering and agent tooling
- Multi-agent orchestration, review gates and guardrails for coding agents
- Full-stack SaaS architecture and type-safe TypeScript systems
- Developer tools, CLIs, VS Code extensions, open source
- AWS Lambda, serverless systems, queues, rate limiting
- Scraping infrastructure and browser automation
- Monorepos, CI/CD, release automation
- Migrations and redesigns on live products without regressions
- Authentication, two-step verification and access control
- 0-to-1 product development in startup environments

Experience

Product Engineer · LightWork AI · London, UK (Remote) · Jun 2025 – Present

- Shipped features across frontend, backend, infrastructure, and product workflows on an AI-powered property-management platform.
- Built AI agent tooling that lets the product take structured actions on behalf of users.
- Led a major frontend redesign across core product surfaces, delivered incrementally behind feature flags with no feature freeze, and retired the old versions of the app in one cutover without regressions.
- Re-platformed the web app onto a new framework, and led its move into a new codebase.
- Implemented internationalization across the redesigned product flows, with an automated parity check across languages and no growth in bundle size.
- Improved build performance, CI reliability, and developer-experience tooling across the engineering team: Docker builds centralized in the monorepo, smarter builds, faster test suites and cold builds through a faster compiler, and a flaky out-of-memory coverage job made stable.
- Automated the path to production: changes labelled by area, promotion between environments with no hand-made pull requests, and CI results in chat.
- Made two-step sign-in mandatory for every account, server and UI: email codes, Google sign-in, trusted devices, password policy, lockout and per-organisation controls.

Creator & Maintainer · Open source (ZeroStarter, Playground) · Nov 2025 – Present

- Built ZeroStarter, a type-safe SaaS starter on Bun, Hono, Better Auth, Drizzle and TanStack: shared types from database to UI, one database schema, self-healing release automation, and an agent sign-in for AI agents.
- Built Playground on ZeroStarter: an agent factory on Claude Code, skills, MCP and the Claude Agent SDK, where sessions plan, build, review and merge software from a live dashboard, behind review gates and guardrails.
- Both are public on GitHub, and ZeroStarter installs with one command.

Product Engineer · Stealth AI Startup · Oct 2023 – May 2025

- Early product engineer building a new AI product from 0 to 1 across the full stack.
- Built frontend and backend features end to end, from product UI through APIs, data, and deployment.
- Integrated LLM workflows into the core experience, turning AI prototypes into production capabilities.
- Helped define the product's early technical foundation as part of a small engineering team.

Senior Developer · Warewe · New Delhi · Sep 2022 – Sep 2023

- Built Hetrolinks, a SaaS for repairing broken Amazon affiliate links: engineered AWS Lambda as rotating proxies to bypass captcha for ~90% proxy-cost savings, plus a scraper covering 2,000+ pages in 5-10 min.
- Re-architected the backend from Python to Node.js on AWS Lambda for ~50% better performance, with queueing and rate limiting for concurrent jobs.
- Built SerpWe end to end: ran Puppeteer on Lambda over thousands of Google results, clustered keywords by SERP overlap to infer search intent, and wrote 100% of the Next.js admin dashboard.

Full-Stack Developer · VeroXyle · New Delhi · May 2020 – Aug 2022

- Delivered and maintained 10+ client-facing web projects across frontend and backend.
- Automated CI/CD pipelines (~40% faster deploys) and built nginx/Certbot deploy and server-management tooling that cut infra costs ~20%.
- Standardized API patterns across projects, improving development turnaround ~30%.

Intern · SSIM Dwarka · New Delhi · Nov 2019 – Apr 2020

- Built, deployed, and managed the website for the institute.

Selected Projects

1,100+ GitHub stars, 250+ repositories, 13,500+ VS Code installs and 30,000+ weekly npm downloads across 40+ packages. The strongest:

- **gitpick** - TypeScript, Bun. A zero-dependency degit replacement that clones any file, folder, or branch by URL: 345,000+ npm downloads in the last year; used by TanStack Router, SST, Electric SQL, and Storybook.
- **smart-registry** - TypeScript. A zero-config shadcn registry builder that auto-detects files and dependencies, removing most registry.json boilerplate.
- **karabiner-human-config** - TypeScript. A human-readable Karabiner config compiler, listed among the official Karabiner-Elements generators.
- **rdt.li** - Next.js, Drizzle, Postgres. A self-hostable, open-source URL shortener with analytics, charts, and one-click deploy.
- **tailwind-animate** - TypeScript. A Tailwind CSS v4 animation plugin replacing tailwindcss-animate: 22,000+ weekly npm downloads.
- **shadcn-ui snippets** - VS Code, Bun. An editor extension for shadcn/ui snippets, 13,500+ installs across its two Marketplace listings, built via a Markdown-to-snippet pipeline.
- **onset** - Next.js, Drizzle, Auth.js. A documented full-stack starter that teaches the architecture step by step.

Skills

- AI & agents: Claude Code (hooks, skills, AGENTS.md), Claude Agent SDK, MCP servers (GitHub, Linear, Slack, Notion, Datadog, PostHog), Vercel AI SDK, OpenAI Agents SDK, OpenAI API, agent-browser and agent-desktop automation, multi-session orchestration, LLM-as-judge review gates
- Languages: TypeScript, JavaScript, SQL, Python, Bash, HTML/CSS
- Frontend: React, Next.js (App Router), TanStack Router/Query/Form/Table, Tailwind CSS, shadcn/ui, Base UI, Radix, React Hook Form, Zod, Streamdown, Fumadocs, MDX, SSR/SSG, PWA, Accessibility, Web Vitals
- Backend & APIs: Node.js, Bun, Hono (+ RPC), NestJS, Express, Elysia, tRPC, REST, OpenAPI/Scalar, WebSockets, Better Auth, OAuth and two-step sign-in flows, queues, rate limiting, caching
- Databases: PostgreSQL, Drizzle ORM, Prisma, MongoDB, Redis (Upstash)
- Cloud & Infra: AWS (Lambda, EC2, S3, RDS, SQS, SES, CloudFront, API Gateway, IAM), SST + Pulumi, Cloudflare Workers, Vercel, Docker, nginx, headless browsers on Lambda
- Tooling & Quality: Turborepo, Bun/pnpm workspaces, tsdown/tsup, oxlint/oxfmt, GitHub Actions (OIDC publishing), conventional commits, changesets, automated changelogs, lefthook, portless, Vitest, bun test, Playwright, browser-driven end-to-end tests, PostHog

Education

B.Tech, Electronics & Communication Engineering

Delhi Technical Campus (GGSIPU), New Delhi · 2016–2020
